VEIN CLINIC

Varicose Veins & PAD

An estimated 40% of women and 25% of men are affected by **Varicose Veins** and another 8-12 million in the US are affected by PAD (**Peripheral Arterial Disease**). Common symptoms include leg pain, cramping, restless legs, fatigue, heaviness, swelling, bulging veins and spider veins. Most of our patients are experiencing one or two symptoms when they initially visit.

Endovenous Laser Treatment

Endovenous laser treatment is a minimally invasive varicose vein treatment alternative to the more traditional method of ligation and vein stripping. A thin fiber is inserted into the damaged vein via a very small skin nick. Laser light energy is delivered to the targeted tissue, which reacts with the light, causing the vein to close and seal shut.

CLINICAL TRIALS

Our practice participates in world renowned Clinical Research studies that offer our patients the ability to participate in cutting edge therapies (medicinal) and procedures (device) if they have: High Cholesterol, PAD, AFib, CAD and certain cardiovascular risks.

Research participation is at no cost with travel reimbursement. Ask our doctors about a research opportunity for which you may qualify. To learn more about these opportunities call **219-934-4200**.
